Amazing mobile 10-01-2010, 05:23 PM This is cool, but \$70 is a little too much for it. If you want a serious dictionary, I'd suggest Chewnutz's site as it's free. He's been doing this for years. -D B Euph 10-01-2010, 06:17 PM "Flexdict" is not a real dictionary, just a real dictionary viewer. Stumpy 10-01-2010, 08:11 PM Very interesting! B Euph 10-01-2010, 09:14 PM There you go! -D Flexdict 10-01-2010, 11:46 PM Thanks, it is very interesting! The program is not a free dictionary. The "Realdiction" software is. Hope this is of help Effect of methylprednisolone pulse therapy on neurological outcome in patients with acute cerebral infarction. To clarify the effect of methylprednisolone pulse therapy (MPT) on neurological outcome in patients with acute cerebral infarction (ACI), we performed a multicenter, randomized, placebo-controlled trial of MPT. Of 205 patients with ACI enrolled at 7 institutions, 200 were finally analyzed. Seventy-five patients received MPT (MPT group) and 125 patients received placebo (control group). The treatment periods and examinations were performed on days 1, 3, and 7 after onset. The disability of ACI and the neurological findings at the time of the follow-up examination were compared between the MPT group and the control group. On day 7, the disability was significantly less in the MPT group than in the control group ($p=0.035$). In subgroup analysis, there was a significant difference in disability between the MPT and control groups in the patients without parenchymal hematoma on day 3 ($p=0.017$), but not in patients with parenchymal hematoma on day 3 ($p=0.12$). There were no significant differences in neurological findings at the time of follow-up examination between the MPT and control groups. On day 7 after onset, MPT significantly reduced disability in patients without parenchymal hematoma on day 3. This reduction in disability was observed only in the patients without parenchymal hematoma on day 3, and MPT was effective for the prevention of hematoma growth and recovery of brain tissue with reperfusion.

Post-endodontic management of traumatic dental injuries: when and how? Traumatic dental injuries are among the most prevalent human health problems worldwide. The prevalence of this pathology is greatly influenced by the individual's risk and sociodemographic factors. The objective of this review was to update the concept of post-endodontic management of traumatic dental injuries, focusing on the short- and long-term healing of tooth injuries. A literature search was performed by a qualified librarian for the following keywords: 'dental trauma', 'intact tooth', 'fracture', 'root fracture' and 'post-endodontic management'. Clinical evidence suggests that the spontaneous repair process of tooth fractures and root fractures is asymptomatic, but it can be compromised by an incorrect interdental splinting. Post-endodontic treatment of dental injuries has the potential to influence the healing process, thus requiring close monitoring to avoid complications and to improve the long-term prognosis.
