Excel 2010 is the latest version of the **Microsoft Excel** product. This release includes a number of new features, such as **SRP**. SRP is a visual programming and spreadsheet with a fully integrated code editor. It can be used to create new macros and modules in a matter of minutes. One of the best features in Excel 2010 is the dynamic datasheet that is built into the product. The datasheet feature allows you to connect to a database and analyze the information in a way that is a lot more intuitive than using just a spreadsheet.

One of the inherent problems of conserving old photos is in the basic editing features. Past attempts to fix can result in more problems than solutions. For example, older images may have had some unevenness, such as a low-polygon count texture or a paintbrush *grass* in the subject's hair; Image Shake can help by blurring and then *sharpening* the image, but that process is often not speedy, and it can result in other types of artifacts. Pros:

- It has a good importing manager, but I don't like the built-in library. I use Lightroom for managing and organizing photos. With that built in, it takes up a lot of computer memory.
- It has a good library management, but doesn't support the common exif and xmp tags (but it supports a lot of other proprietary formats).
- It has filters, LUTs and HDR, but not all of them are complete.
- You can export images in non-destructive mode.
- Drag and drop for image order. You can also drag an image to a new location, or drag multiple files from a folder.
- There is a global shortcut to undo (CTRL+Z).
- You can use it for web development. It has CMYK tools and is linked to the GoToTransparency feature of Fireworks.
- There is a display ruler (not standard), link to the cropping tool, help.
- Loads of exporting tools (including links to more than one country and multiple sites).
