KEYMACRO Description: Up to four different versions of any given keystroke sequence can be stored in a keyboard. You can assign a name to each of them, and then execute a sequence of keystrokes that performs only one of the following actions. Simply press the keyboard's assigned keystroke(s) to apply a macro. If you hold down a modifier key, the macro can perform the same function on the modifier key as well. **Using Macros:** In most cases, you'll never need to directly type a specific character. Instead, the different keys on the keyboard become your tools for performing actions, from simple ones like

opening a program to more complex ones like performing a search. You can save keystrokes by creating macros that assign a simple keystroke sequence to perform a specific action. For example, you can assign a keystroke to open your web browser and go to Google.com. This is called a “hot key” or a “hot macro.” Hot keys and macros are found under the “Macros” tab of the Keyboard System Preferences pane. All you have to do is first select a keystroke you’d like to save. Once the keystroke has been selected, press Command-Shift-I to bring up the Keyboard window. From there, select the Macro option, and then select the keyboard icon. The new macro should now be listed in the pull-down menu next to the original keystroke. Now, whenever you want to perform the assigned function, simply press the new keystroke. Pressing Command-Shift-I will return you to the

Keyboard System Preferences pane. Some keys, such as the escape key, are not allowed to be used as hot keys. You can work around this limitation by choosing “Control Strip” as the modifier key on your keyboard.

Keyboard Shortcuts: Keyboard shortcuts are sets of keystrokes, known as combinations, that you can assign to perform specific actions. If you want to use your keyboard as a calculator, for example, you can assign the combination of Command-2 to perform the addition function. You can save keyboard shortcuts under the Keyboard Shortcuts pane, and make them appear whenever you’re in the Keyboard System Preferences pane.

Custom Shortcuts: Custom shortcuts are just like keyboard shortcuts, but you can assign any combination of keystrokes to perform the function you desire. Like keyboard shortcuts, custom shortcuts can be accessed from the `2edc1e01e8`
