Medulloblastoma is a highly malignant brain tumor of childhood that is difficult to treat, and the outcome of the disease remains dismal despite advances in surgery, radiation, and chemotherapy. Therefore, there is a continuing search for new molecular targets for effective therapy. A somatic mutation in BRAF, an oncogene commonly found in melanoma, has recently been identified in a subset of medulloblastomas. In these tumors, the BRAF amino acid substitution p.V600E causes a gain of function, resulting in increased kinase activity and enhanced tumor cell proliferation and survival. The goal of this study was to examine the expression and oncogenic potential of the BRAF(V600E) mutation in medulloblastoma. For this purpose, we examined 45 human medulloblastomas, including a panel of primary cell lines and a panel of immortalized human medulloblastoma cell lines, for expression and mutational status of BRAF. All medulloblastoma cell lines examined contained the BRAF(V600E) mutation, which was absent from normal cerebellum and the three previously reported cases of sporadic adult human medulloblastomas. Immunohistochemistry demonstrated that BRAF(V600E) was expressed in the vast majority of medulloblastomas. Electrophoret 79a2804d6b
