I strongly recommend upgrading to a new Mac instead of skimping on the hardware because I don't want to be hosed if Elements doesn't play well with your Mac. If you can live with conversions instead of a new Mac or if you already have Photoshop CS or Premiere, you may want to consider buying a dedicated graphics tablet, such as the Wacom Intuos or Cintiq. Aside from that, Lightroom has also added several useful editing functions such as the introduction of the Smart Brush and Smart Backlight functions. The Smart Backlight features are just like its namesake: when you're shooting in low light conditions, it automatically lightens the areas that are in shadow. It's a smart form of Photoshop-like "smart editing" rather than brightening the shadow areas manually. Object Selection in Photoshop Elements no longer needs to be a 100% perfect job (as a CS user, I'm still spoiled by the ability to simply "set" freeform selections). On Windows, you can now use the File, New, Set Selection... command from the Tools menu, which creates a loose selection around an object. You can then fine-tune the object's size and position using the mouse, with each drag making a single selection. I found this out, while I could only summon the courage to admit what I was about to do where it was no longer relevant. Luckily, Lightroom 5's ability to bring in a color from the Web was helpful in this task.

By selecting the color I had found, as a 2-channel bunch of colors, I was able, after a while, to use the normal 'Paste Into' or 'Paste from the Web' functionality provided by Photoshop, to upload the color directly to the image without any repercussions.

The majority of the new features and updates have been designed to improve functions, usability and performance. The creative improvements are meant to help you produce gorgeous images faster while the performance upgrades are designed to improve things like drawing and performance.
